Performance varies based on the amount of data and installed RAM.</p>

mWorkOrder Release Notes

What's New

Improvements

Added Notification Alert in Work Order Form PDF

In the Forms module, when a Work Order Form PDF is generated, the system now identifies and reflects any notification triggered against the corresponding task in the work order.

This ensures clear visibility of reported issues, improves traceability, and enables stakeholders to review notification details accurately even in offline or shared document scenarios.

This feature supports the **iOS** platform.

Enhanced Equipment-Based Form Assignment

In the Forms module,

- The system now supports assigning and auto-suggesting forms based on the Technical Type of equipment (such as Pump, Valve, or Motor).
- When an equipment is selected in a work order, inspection, or task, only the relevant forms mapped to that technical type are automatically displayed or suggested.
- This does not impact existing form assignment methods, and users can still manually add forms as needed.

This improves data quality and compliance by ensuring the right forms are used for the right equipment.

This feature supports the **ABAP** platform.

Enhanced Reporting for Multiple Form Versions

Saved and submitted entries for multiple form versions are now captured and displayed in the Appuse table and KPI reports.

This improves reporting accuracy.

This feature supports the **ABAP** platform.

Automated Email Alerts for Component Updates

mWorkOrder Release Notes

Users can now send email notifications to the warehouse supervisor based on the configured plant when a work order component is added or updated.

This improves coordination and response time.

This feature supports the **ABAP** platform.
